

# R for Computational Sciences

*Part 1. getting started, EDA, data wrangling*

John Little

Center for Data & Visualization Sciences

# R for computational sciences

getting started, EDA, data wrangling

## Flipped Workshop

Sept. 15, 1pm to 3pm

15:00

# Whoami

John Little  
Data Science Librarian  
Host of [Rfun.library.duke.edu](https://rfun.library.duke.edu)  
Center for Data & Visualization Sciences

# ***Duke University: Land Acknowledgement***

I would like to take a moment to honor the land in Durham, NC. Duke University sits on the ancestral lands of the Shakori, Eno and Catawba people. This institution of higher education is built on land stolen from those peoples. These tribes were here before the colonizers arrived. Additionally this land has borne witness to over 400 years of the enslavement, torture, and systematic mistreatment of African people and their descendants. Recognizing this history is an honest attempt to breakout beyond persistent patterns of colonization and to rewrite the erasure of Indigenous and Black peoples. There is value in acknowledging the history of our occupied spaces and places. I hope we can glimpse an understanding of these histories by recognizing the origins of collective journeys.

# Attendance by Discipline

# Consulting and Assistance

Title	URL	
Schedule me for consultations	<a href="https://is.gd/littleconsult">https://is.gd/littleconsult</a>	
Consulting & <a href="mailto:AskData@Duke.edu">AskData@Duke.edu</a>	<a href="https://library.duke.edu/data/consulting">https://library.duke.edu/data/consulting</a>	

We're happy to consult with you

In a consultation, let us help make the details of R relevant to your project

# Resources

It's all online

# Reprex

*The most efficient way to get help*

REPRoducible EXample and Code

<https://reprex.tidyverse.org>

Use the smallest, simplest, most built-in data possible

Include commands on a strict “need to run” basis

# Pipes and Assignment

A couple things to remember...

# Assignment

Give an object name particular value

`<-`

"gets value from"

```
answer <- 5 * 5
```

```
mutate(answer2 = answer * 2)
```

Keyboard shortcut for `<-` is *alt-dash*

# Pipe

Chain functions together (a tidyverse or magrittr conjunction)

`%>%` **or** `/>`

"and then"

```
answer %>% sqrt()
```

Keyboard shortcut: *Ctrl/Cmd-Shift-M*

# Definitions

R is a **data-first programming language** with mature sense of the *data life-cycle* and reproducibility

**R** - programming language / language interpreter

**RStudio** - an IDE or Integrated Development Environment

**Tidyverse** - a coherent and opinionated system of packages for data manipulation, exploration, and visualization

# Definitions

Tidy data - a foundational concept governing the shape of your data. <https://vita.had.co.nz>

# Outline

Reproducibility

RStudio projects

Literate coding / Coding Notebooks

5 dplyr verbs

# Reproducibility

*Obtaining computational results using the same input data, computational steps, methods, code, and conditions of analysis*

# RStudio projects

Managing each project in a discrete directory that can be easily shared with others. That is, your projects can work on other computers without rewriting the code.

- Enables the use of relative paths instead of `setwd()`
- Using R Markdown to Restart R and run all chunks instead of `rm(lists = ls())`
- Integrates with version control (e.g. *Git*)

# Literate coding

*Integrate and intersperse prose with code. Explain your analysis with natural language. Ideally, render various outputs from the same code-prose document*

R Markdown & Jupyter notebooks are an example of literate coding

# Why

Using *reproducibility* and *literate code* techniques within *RStudio projects* + *version control* enables better workflows; workflows that are not dependent on cut & paste mousing

Today, we'll use .Rmd files to render R Markdown notebooks

# **dplyr**

A grammar of data manipulation

- consistent verbs to solve common data transforms
- <https://dplyr.tidyverse.org/>

# Five *dplyr* Verbs

Function	Usage
filter	subset rows
select	subset columns
arrange	sort rows by variables
mutate	change cell or variable values
count	
summarize	powerful when used with <code>group_by()</code>

There are many more dplyr functions

**filter** Subset **Rows** by variables

```
starwars %>% filter(eye_color == "orange")
```

## **select** subset by columns (variables)

```
starwars %>% select(hair_color, eye_color)  
starwars %>% select(2:4)  
starwars %>% select(name:mass, 10, 7, 4:6)
```

## arrange Sort **Rows** by variables

```
starwars %>% arrange(eye_color)
starwars %>% arrange(desc(eye_color))
starwars %>% arrange(desc(eye_color), hair_color)
```

## mutate Change cell values

```
starwars %>% mutate(big_mass = mass * 100)
starwars %>% mutate(BMI = (mass / (height/100)^2))
starwars %>% mutate(
  nickname = str_c("Big", str_to_upper(hair_color),
    sep = " ")
```

***count*** *Count observations by group*

```
starwars %>% count(gender)
```

***summarize*** *Reduce multiple values down to a single line*

```
starwars %>%  
  drop_na(height) %>%  
  summarise(n(), n_distinct(height), min(height), max(height))
```

```
starwars %>%  
  drop_na(height) %>%  
  group_by(gender) %>%  
  summarise(Total = n(), n_distinct(height), min(height))
```
